Professional Summary

Senior QA and test professional with 8+ years of experience across web applications, APIs, data platforms and cloud environments. Experienced in leading testing across complex deliveries, working directly with clients and engineering teams and improving automation, integration coverage and release confidence. Strong technical background in CI/CD, test environments and data quality with experience leading teams and supporting planning and estimation.

Skills

Automation	Playwright, Cypress, Pytest, Cucumber, Gherkin, Selenium WebDriver
Programming	Python, SQL, TypeScript, JavaScript
Frameworks	Playwright framework design, fixtures, reusable components, test utilities, test data management
Testing	Functional, regression, integration, end-to-end, exploratory, UAT
API & Integration	REST APIs, OpenAPI, Postman, service integration, negative testing
Test Data	Data setup, SQL validation, Great Expectations, dbt, reconciliation
CI/CD	GitHub Actions, Jenkins, Docker, quality gates, Git workflows
Cloud & Observability	AWS, CloudWatch, Azure, GCP, logs, pipeline diagnostics
Tools & Delivery	Jira, TestRail, Confluence, Git, Agile, Scrum

Technical Experience

Cirun Labs **Apr 2026 — Present**
Head of QA (Freelancer) *Remote*

- Lead QA for Cirun's platform across web applications, APIs and backend services, covering new features, regression changes and production fixes.
- Leading the migration of the existing Cypress automation suite to Playwright, improving test structure, reliability and maintainability.
- Reworking shared fixtures, test utilities and reusable components so the Playwright framework is easier to extend and debug.
- Build automated UI and backend tests using TypeScript and Python.
- Develop REST API tests covering authentication, business rules, error handling and service integrations.
- Work with Engineering while features are being developed, raising unclear behaviour and edge cases before they become release issues.
- Investigate failures using browser behaviour, API responses, logs and backend data, then give engineers enough detail to reproduce and fix the problem quickly.
- Run regression coverage through GitHub Actions and review failed runs before releases.

Fospha **Jan 2026 — Apr 2026**
QA Engineer *London*

- Tested Fospha's customer-facing analytics platform across the dashboard, APIs and backend data.
- Built Playwright automation for key dashboard journeys using reusable page objects, fixtures and controlled test data.
- Automated REST API tests using Python and Pytest, covering normal flows, error scenarios and business rules.
- Used Python and SQL to investigate data differences and trace issues between backend results, API responses and the dashboard.
- Validated customer-segmentation outputs before release, including checks around XGBoost and Elastic Net model results.
- Worked with engineers, Product and Data Science to reproduce issues, clarify expected behaviour and verify fixes.

ITV **Nov 2022 — Apr 2025**
Test Engineer (Data Quality) *Hybrid, London*

- Led testing across several data, integration and migration workstreams supporting broadcast and streaming platforms.
- Defined test approaches for complex changes spanning APIs, data pipelines, downstream reporting and system integrations.
- Worked with Product, Engineering and Delivery teams to agree coverage, manage dependencies and resolve delivery risks.
- Built reusable Python and SQL validation using Great Expectations and dbt, reducing repeated manual checks across multiple data flows.
- Developed REST API tests covering authentication, pagination, filtering, response validation and negative scenarios.
- Worked with Airflow-managed pipelines, validating scheduled workflows, task dependencies and downstream data outputs.
- Used risk-based testing for large migration work, combining detailed reconciliation of critical data with scalable automated checks.
- Produced clear quality reporting for technical and business stakeholders, covering test progress, defects, coverage gaps and areas of release risk.
- Investigated cross-system failures using Python, SQL, API responses and logs, coordinating fixes across the teams involved.

Shruti Priya

Portfolio: pshruti.com
github.com/ipshruti
linkedin.com/in/ipshruti

- Contributed to planning, estimation and resourcing discussions where testing effort had to be balanced across concurrent workstreams.
- Reviewed existing QA processes and proposed improvements to automation, data validation and test coverage where recurring issues showed gaps.
- Supported and mentored other testers and engineers on data validation, defect investigation and practical test design.

Aktech Labs **May 2022 – Nov 2022**
SDET / QA Engineer (Data Pipeline QA / Infra Testing) *Remote*

- Built Selenium and Python-based automation for platform workflows and web interfaces across AWS, GCP and Azure.
- Developed API, integration and data checks for distributed services and cloud-based workflows.
- Added regression and integration suites to GitHub Actions so failed validation could prevent unreliable deployments.
- Tested service interactions, configuration changes, failure handling and recovery across multiple cloud environments.
- Worked directly with engineers to investigate environment and integration failures and improve deployment reliability.

Gartner **Jun 2021 — Apr 2022**
Test Engineer *Remote*

- Developed automated validation tests for ETL and machine-learning pipelines using Python and SQL.
- Evaluated image-classification outputs and prediction scores, checking accuracy, consistency and behaviour across different datasets.
- Analysed model and pipeline performance data to identify systematic quality issues and areas requiring stronger controls.
- Presented findings to engineering and leadership teams, translating technical analysis into clear recommendations and process improvements.
- Worked with data and engineering teams to investigate failures, validate corrective changes and improve pipeline reliability.

Cognizant **Dec 2017 — Jun 2021**
Programmer Analyst, Travelers - Insurance *Chennai, TN*

- Built and maintained Java-based Selenium automation for business-critical insurance policy and claims workflows in a regulated environment.
- Used Cucumber and Gherkin to organise readable business scenarios and reusable automation steps for functional and regression testing.
- Developed Java-based REST API validations and supported end-to-end testing across user interfaces, backend services and data layers.
- Integrated regression suites with Jenkins, maintained automation code in Git and investigated failed runs before release decisions.
- Worked in Scrum teams using Jira for test planning, defect management, sprint execution and release tracking.

Programmer Analyst Trainee, MetLife *Chennai, TN*

- Involved in automating & manual testing and enhancing the CAS application.

Education

Bachelor of Technology in Computer Science, *Lovely Professional University* Jun 2017
